10 Million Ounces Buried in Granada Gold's LONG Bars Zone???

Leading Engineering Firm Steps In With Innovative Production Scenarios

There's growing excitement on the exploration front in Quebec these days, and one of our old favorites at BMR - a "10-bagger" on two occasions since 2010 (as recently as 2016) - is about to flex its muscles again with the help of fresh drill results, an updated resource estimate, and innovative new production scenarios for a project on the outskirts of Rouyn-Noranda that was granted a long-awaited mining permit just over a year ago.

Granada Gold (GGM, TSX-V), formerly Gold Bullion Development, woke up out of a winter slumber on intriguing news last week and has momentum in its favor as Q2 begins based on the following 3 near-term potential catalysts:

- **The credibility and proven track record of new "partner" DRA Global**
- **A proposed 12,000 tonne-per-day "pre-concentration" facility for Granada**
- **Robust new Granada resource estimate on the way (drilling since last fall)**

80% of LONG Bars Zone yet to be explored. LONG Bars mineralized gold zone open in all directions and depth.

EAST

The "Upgrader Effect" - 10-Fold Increase in Grade!

One major advantage of Granada ore is that it's amenable to "pre-concentration", a fact Gekko Systems of Australia discovered when it turned half gram material from Granada into nearly 5 g/t - a whopping 10-fold improvement in grade – as reported by GGM May 7, 2015.

- **Upgrader effect achieved through conventional gravity and flotation concentration**
- **Exceptional recoveries up to 97% from metallurgical test work**
- **Granada + technology = high value LONG Bars Zone**

DRA Goes a BIG Step Further!

While not yet disclosing its exact methodology, DRA Global proposes taking full advantage of the special characteristics of Granada mineralization through a 12,000 tonne-per-day pre-concentration ore sorting facility at the mine site that uses the latest technology to allow downstream processing to be undertaken on a richer (higher grade) stream of material.

- **Pre-concentration (500 tonnes per hour, 12,000 tonnes per day!)**
- **1,200 tonne-per-day mill, double the original plan and all "in-house"**
- **End result = more efficient operation, dramatically reduced costs per tonne**

A change in the mining plan at Granada needs to be supported by an updated Pre-Feasibility Study to demonstrate technical feasibility and economic viability, but few are better at this game than DRA which explains their heavy involvement in such an important and high-profile project also based in Quebec - Nemaska Lithium's (NMX, TSX) Whabouchi mine.

"The project benefits from increasing its size due to the amenability of the mineralized material to simple concentration, thereby lowering reagent consumption and due to a low waste to ore ratio that will reduce operating costs."

Frank Basa, GGM President & CEO, at Granada Gold Property as it moves closer to the production stage.
